What is health expectancy?

Health expectancies were first developed to address whether or not longer life is being accompanied by an increase in the time lived in good health (the compression of morbidity scenario) or in bad health (expansion of morbidity). So health expectancies divide life expectancy into life spent in different states of health, from say good to bad health. In this way they add a dimension of quality to the quantity of life lived.

How is the effect of longer life measured?

The general model of health transitions (WHO, 1984) shows the differences between life spent in different states: total survival, disability-free survival and survival without chronic disease. This leads naturally to life expectancy (the area under the ‘mortality’ curve), disability-free life expectancy (the area under the ‘disability’ curve) and life expectancy without chronic disease (the area under the ‘morbidity’ curve).

There are in fact as many health expectancies as concepts of health. The commonest health expectancies are those based on self-perceived health, activities of daily living and on chronic morbidity.

How do we compare health expectancies?

Health expectancies are independent of the size of populations and of their age structure and so they allow direct comparison of different population sub-groups: e.g. sexes, socio-professional categories, as well as countries within Europe (Robine et al., 2003).

Health expectancies are most often calculated by the Sullivan method (Sullivan, 1971). However to make valid comparisons, the underlying health measure should be truly comparable.

To address this, the European Union has decided to include a small set of health expectancies among its European Community Health Indicators (ECHI) to provide synthetic measures of disability, chronic morbidity and perceived health. Therefore the Minimum European Health Module (MEHM), composed of 3 general questions covering these dimensions, has been introduced into the Statistics on Income and Living Conditions (SILC) to improve the comparability of health expectancies between countries. In addition life expectancy without long term activity limitation, based on the disability question, was selected in 2004 to be one of the structural indicators for assessing the EU strategic goals (Lisbon strategy) under the name of “Healthy Life Years” (HLY).

What is in this report?

This report is produced by the European Health Expectancy Monitoring Unit (EHEMU) as part of a country series. In each report we present:

- Life expectancies** and health expectancies based on activity limitation (HLY) for the country of interest and for the overall 25 European Union member states (EU25), using the SILC question on long term activity limitation for 2005 and 2006. As the SILC has been only recently initiated, to document trends we provide previous HLY series based on the disability question of the 1995-2001 European Community Household Panel (ECHP)
- health expectancies based on the two additional dimensions of health (chronic morbidity and self-perceived health) for the country of interest, based on SILC 2006
- a global analysis of health expectancies of European countries, based on the SILC 2006

Further details on the MEHM, the European surveys and health expectancy calculation and interpretation can be found on www.ehemu.eu.

*Nevertheless, before 2008, the translations of the module used in some countries were not optimum (See Eurostat-EU Task Force on Health Expectancies common statement about the SILC data quality); ** Computed with the Eurostat method.
Life expectancy (LE) and Healthy Life Years (HLY) at age 65 for Finland and the European Union (EU15 and EU25) based on ECHP (1995-2001) and SILC (2005-2006)

Key points:

- Finnish life expectancy (LE) at age 65 has increased by 2.3 years for women and 2.2 years for men over the 1996-2006 period: it was below the EU15 average in 2001 but was above the EU25 average by 2006 for women and similar to the EU25 average for men.

- Over the 1995-2001 period, health expectancy based on activity limitation (HLY) at age 65 from the ECHP data remained stable for women and increased for men. Therefore the proportion of HLY (or years without self-reported limitations due to health condition or disability), within the total expected years, slightly decreased for women and increased for men, being 36% for women and 40% for men in 2001. Between 1996 and 2001 HLY in Finland was below the EU15 average.

- The new HLY series, initiated in 2005 with the SILC data, shows values for Finland in 2006 of 1.5 and 2.6 years below the EU25 average for women and men respectively. In 2006 women and men at age 65 could expect to spend 35% and 36% of their life without self-reported long-term activity limitations respectively. Between 2005 and 2006 HLY increased for women in Finland and remained almost the same for men.
Life and health expectancies at age 65 based on activity limitation (Healthy Life Years), chronic morbidity and perceived health for Finland (Health data from SILC 2006)

Key points:
- In 2006, LE at age 65 in Finland was 21.2 years for women and 16.9 years for men.
- Based on the SILC 2006, at age 65, women spent 7.4 years (35% of their remaining life) without activity limitation (corresponding to Healthy Life Years (HLY)), 7.7 years (36%) with moderate activity limitation and 6.1 years (29%) with severe activity limitation.*
- Men of the same age spent 6.1 years (36% of remaining life) without activity limitation compared to 6.8 years (40%) with moderate activity limitation and 4.1 years (24%) with severe activity limitation.*
- For all the health expectancies the years of life spent in positive health were greater for women than men. However, women spent about the same proportion of their life in ill health than men.

These results should be interpreted cautiously given the lack of the institutional population and in some countries the small sample size. The sample size for Finland comprised 996 women and 773 men aged 65+ years.

* These may not sum to Life Expectancy due to rounding.

Published results and other reports of health expectancies for Finland

Healthy Life Years in Europe at ages 25, 50 and 65 in 2006

The top two graphs in the figure below show for men and women separately Healthy Life Years (HLY) and life expectancy at different ages for the newly joined EU10 countries, the established EU15 countries and the EU25 as a whole. The two lower graphs show HLY as a proportion of life expectancy for each of the ages and country groupings. The key points are:

- LE at age 25 is less in the EU10 countries than the EU15, by 6.5 years in men and 3.8 years in women. Differences between the EU10 and EU15 in LE reduce with age and by age 65 are 3.3 years for men and 2.7 for women.

- Differences in HLY between the EU10 and EU15 are smaller than differences in LE at all ages; at age 25 men in the EU10 have 5.5 years fewer free of activity limitation than men in the EU15 and women have 2.6 years fewer. Differences reduce with age for men but are relatively static for women; by age 65 differences are 2.6 years for men and 2.3 years for women.

- The proportion of remaining life spent free of activity limitation reduces with age but values are very similar in the EU10 and EU15.

About EHEMU

The European Health Expectancy Monitoring Unit (EHEMU) and its current project European Health and Life Expectancy Information System (EHLEIS) are funded by the European Public Health Programme (2004-2008) and is a collaboration between: the French national institute on health and medical research (INSERM) and CRLC (Montpellier, France), the University of Leicester (UK), the Scientific Institute of Public Health (ISP Belgium), the French National Institute of Demography (INED), University Charles (Czech Republic), Erasmus University Medical centre (The Netherlands) and University of Rostock (Germany). EHEMU aims to provide a central facility for the co-ordinated analysis, interpretation and dissemination of life and health expectancies to add the quality dimension to the quantity of life lived by the European populations. Further details about EHEMU can be found on the websites: [www.ehemu.eu](http://www.ehemu.eu) and [www.healthy-life-years.eu](http://www.healthy-life-years.eu)
